Product Brochure

- RETENTION
- DETENTION
- INFILTRATION
- WATER QUALITY
Managing high levels of stormwater is a challenge facing municipalities across the country. In built-up areas, buildings and paved surfaces inhibit the natural infiltration of stormwater into the ground. With expanding urbanization, existing infrastructure is unable to accommodate the increased peak flows and runoff volumes which lead to ponding and flooding problems. Conventional stormwater management systems such as ponds, swales, pipe and concrete structures capture water but are labor intensive, expensive to maintain and occupy valuable land. CULTEC Stormwater Chambers provide a cost-effective solution for underground detention and infiltration.

What sets us apart from other chambers? Stormwater chambers are our specialty.

As the founder of plastic chamber technology, CULTEC’s expertise lies in the innovation and evolution of chamber systems. We are equipped to solve even the most challenging stormwater management assignments.

- The first stormwater chambers ever manufactured with installations dating back over 30 years.
- CULTEC stormwater chambers are designed to withstand AASHTO HS-25 defined loads when installed according to our recommended installation instructions.
- Most extensive product line in the industry. With chamber heights from 8.5” to 48” tall, CULTEC offers an extensive product line capable of accommodating both extreme low-profile limitations as well as high-volume demands.
- Our unique internal manifold feature allows for maximum design flexibility, provides a significant cost-savings to the overall project, and, in most applications, can also reduce the system footprint. It allows for placement of the manifold at any location within the system without interrupting the line of chambers and eliminates the requirement of manholes and/or extra fittings.
- Exceptional custom design services performed by stormwater chamber specialists.

Installations Worldwide

With installations dating back to over 30 years, CULTEC products have not only been installed nationally from coast-to-coast but also internationally in Canada, Mexico, Puerto Rico, Guam, the Caribbean, Africa, and Europe. For a recent list of case studies, please visit us at www.cultec.com/case-studies/
CULTEC Stormwater Systems 101 - The Basics

The CULTEC Contactor® and Recharger® chambers replace conventional stormwater retention/detention systems such as ponds, swales, pipe and stone trenches or beds, or concrete structures. The chambers may be used for dry wells. Infiltration contact area is maximized by the fully open bottoms.

Water is collected in a catch basin or other collective device followed by a CULTEC Separator™ Row to be treated. The water is then directed into the Contactor® or Recharger® chambers and distributed via the side portal internal manifold and crushed stone embedment. Depending on the system application, the water infiltrates into the ground, or it is detained and released.

Typical CULTEC stormwater systems are designed by using the largest chamber that meets the site’s depth constraint and system requirements. By choosing the largest available chamber that meets the system’s parameters, you reduce the number of chambers and land area required. The client is able to maximize storage volume at the given workable elevations.

Applications
- Retention Systems
- Detention Systems
- Infiltration Systems
- Reclamation
- Dry wells
- Conveyance
- Manage residential roof drain run-off
- Contain swimming pool or water conditioner backwash

Features
- Overlapping rib connection
- Unique in-line internal manifold
- High infiltrative capability
- Lightweight
- Variety of sizes
- Chemically resistant

System Benefits
- Maximum use of land area
- Store larger volumes in a lower profile than comparably sized pipe
- Ability to recharge water on-site
- Single or multi-level systems
- Less heavy equipment required
- The units nest on pallets for convenient shipping and stockpiling of material
- Allows for greater infiltration into the ground
- Permits further development
- Reduces insurance liabilities and potential breeding grounds for infectious mosquitoes associated with open ponds
Typical CULTEC Stormwater System Components

1. CULTEC Stormwater Chamber - used for retention, detention, reclamation

2. CULTEC HVLV™ Feed Connector - internal manifold component

3. CULTEC Separator™ Row - water quality filtration row

4. CULTEC No. 410™ Non-woven Geotextile - prevents soil intrusion into system

5. CULTEC No. 4800™ Woven Geotextile - placed under CULTEC manifold components, prevents scouring of stone base

6. Stone - used for stone base, embedment stone and stone above chambers

7. CULTEC Warning Tape - marks off location of underground CULTEC Stormwater System during construction to prevent vehicular traffic

8. Multicade™ Pylon - marks location of underground CULTEC Stormwater System during construction phase
In urban areas, rising land costs require developers to look for innovative stormwater management products that optimize land usage and meet local environmental regulations.

CULTEC - The Founder of Plastic Chamber Technology

Back in 1986 CULTEC introduced its Contactor® and Recharger® septic and stormwater chambers to the industry and helped to begin a revolution towards the usage of plastic construction products. Since then, several product developments and strategic alliances have made CULTEC a cutting edge R&D-based manufacturer.

CULTEC’s chambers are dome shaped, open-bottomed corrugated plastic structures. They function like conventional stormwater ponds and work in conjunction with existing storm sewer infrastructure to provide underground retention/detention and infiltration of rainwater into the ground. Infiltration methods have been proven to be the most effective way to remove phosphorous, nitrogen, lead, zinc, suspended solids and organic carbon from water compared to wetlands, water quality ponds, filtering systems and water quality swales.
CULTEC Contactor® & Recharger® Chambers

CULTEC Contactor® and Recharger® chambers can be used as detention systems, infiltration systems or a combination of both. With a wide range of sizes and models available, their advanced design and ease of installation makes them an ideal alternative to ponds, swales, concrete structures or pipe installations. CULTEC chamber systems can be installed with a Separator™ Row, consisting of a row of chambers surrounded by geotextile on all sides. It is designed to capture the first flush of a rain event and is a cost-effective means of removing Total Suspended Solids (TSS) that may pass through the upstream water quality structures. In addition to removing solids and debris, the Separator Row provides easier access for inspection and maintenance of the total system.

CULTEC Contactor® & Recharger® chambers can be hand carried for ease of installation.
CULTEC Stormwater Chambers

**CONTACTOR® SERIES**

The Contactor® series consists of lower profile chambers and are typically used for installations with depth restrictions or when a larger infiltrative area is required.

Sizes range from 8.5 - 12.5 inches (216 - 318 mm) in height.

Available models are the Contactor® Field Drain C-4HD and Contactor® 100HD.

**RECHARGER® SERIES**

CULTEC’s Recharger® series includes higher profile, larger capacity chambers. Sizes range from 18.5 - 48 inches (470 - 1219 mm) in height. Chamber capacities vary from 2.65 - 17.31 ft³/ft (0.246 - 1.61 m³/m).

Available models within this series are the Recharger® 150XLHD, 180HD, 280HD, 330XLHD, 360HD and 902HD.

---

**Detention Systems**

Stormwater runoff exceeding a site’s allowable discharge rate is temporarily stored in chambers connected to a control structure (manhole). Downstream flows are restricted to a set rate using an orifice.

**Detention/Infiltration Systems**

Detention volume is set by the elevation of the outlet pipe to the control structure. Water remaining below the outlet pipe invert will infiltrate providing groundwater recharge.

**Infiltration Systems**

Water enters the chambers via the storm sewer network where it is held until the water infiltrates into the surrounding soils. Systems provide pollutant removal, total downstream volume reduction and temperature control of the downstream flow.

</table>

**NOTES:**
- Based on installed length. Stone void is calculated at 40%. Most models include 6 inch (152 mm) stone base, 6 inch (152 mm) stone layer above chamber crown and stone around units based on typical minimum center-to-center spacing.
- Recharger 902HD assumes 9 inch (229 mm) stone base, 12 inch (305 mm) stone layer above and typical center-to-center spacing.
- Recharger models 360HD and 902HD chambers require a separate end cap.

### MAINTENANCE

To ensure a well-functioning system, regularly scheduled cleaning of catch basins and pre-treatment devices is required. We suggest the inclusion of a CULTEC StormFilter® 330 or CULTEC Separator™ Row in the design for water quality and particulate removal.

### SAFETY FIRST!

Eliminate flooding with CULTEC stormwater chambers
- Reduce road accidents, washouts and driver delays
- Minimize building and property damage, sewer backup and foundation settlement
- Lower clean-up costs, health hazards and environmental damage
Chamber Design

The arched shape and corrugated design of the chamber effectively transfers live and dead loads to the subgrade. Stone columns between chamber rows also share in the load transfer. CULTEC chambers undergo rigorous testing. Select profiles meet the performance requirements of the American Society for Testing and Materials (ASTM) F2418, and meet the loads defined by the American Association of State Highway and Transportation Officials (AASHTO) (Section 12.12) Load Resistance Factor Design (LRFD) and the CAN/CSA-S6-14 CL-625 Design Truck. The Recharger 902HD has achieved third-party certification to the Canadian Standards Association (CSA) B184 standard for polymeric subsurface stormwater management structures. Chambers are constructed of impact-modified and long-term creep resistant polymers, ensuring that the chambers achieve a minimum 50-year service life.

Contact a CULTEC Representative to arrange complimentary design assistance.
You’ll receive project-specific stage-storage calculations, CAD layouts, details and product submittal packages.

CULTEC’s intuitive design tools are also available to manually complete your design.

Download the CULTEC Stormwater Design Calculator, Incremental Storage Calculator and CAD design templates to complete an accurate, site-specific layout complete with stage-storage calculations.

Visit www.cultec.com/stormwater-design.html for design assistance.
## Installation

Refer to CULTEC’s most current installation instructions for further details including but not limited to acceptable fill materials and vehicle loads.

For design assistance, contact CULTEC’s Technical Department at tech@cultec.com or 203-775-4416 ext. 203.
